

# **Obstetric Simulation Scenarios for the Emergency Department**

December 2024

# Introduction

Improving access to high-quality health care is critical to addressing the leading causes of preventable severe maternal morbidity (SMM) and mortality in the United States. **The Alliance for Innovation on Maternal Health (AIM)** at the American College of Obstetricians and Gynecologists (ACOG), which is funded through a cooperative agreement with the Health Resources Services Administration (HRSA), developed this Obstetric Simulation Scenarios for the Emergency Department resource to support response to this need.

## How should these scenarios be used?

These scenarios are intended to be adapted for a variety of facility and resource levels and to meet the goals established by the teams participating in simulation. Each scenario may be used in any level of fidelity simulation, from tabletop or virtual drill use to high fidelity simulation in formal Simulation Centers or with standardized patients.

Simulation is meant to provide a safe environment for learning and preparing to meet patient needs, particularly for high acuity, low frequency events in clinical settings. The use of these scenarios in conjunction with the AIM Obstetric Emergency Readiness Resource Kit, which contains best practices, resources, and planning materials for teams in healthcare settings where obstetric services are not typically provided, may best support provision of high-quality care for pregnant and postpartum people experiencing obstetric emergencies.

## Who should participate in these scenarios?

These scenarios are intended to be run with a full healthcare team that would participate in patient care if the scenarios were to occur. Inclusion should extend, but not be limited to, all Emergency Department personnel, as well as other disciplines, including Anesthesiology, Emergency Medical Services providers, Pharmacy, Social Work/Case Management Services, Radiology, Operating Rooms, Blood Bank/Laboratory Services, and Nursing Administration. This type of facility wide planning for stabilization, transport, and emergency care in obstetrics may allow a facility to test process and procedures well before a patient with these needs presents for care.

## How were these simulation scenarios prepared?

These scenarios were developed by a team of clinicians with expertise in Emergency Medicine, Obstetrics, and simulation. Following development, the scenarios were reviewed by a variety of clinician reviewers, including those that practice in both rural and urban settings.

## Acknowledgements

The AIM TA Center wishes to thank a variety of authors and reviewers who contributed to this resource, including Dr. Tara Lewis, Jaimee Robinson, Leslie Jones, Dr. Jenna White, Dr. Elizabeth Lynch, Kerrie Redmond, and an Emergency Medicine physician from the Louisiana Perinatal Quality Collaborative. AIM staff members including Christie Allen, Amy Ushry, and Izzy Taylor also contributed to this resource.

## OBSTETRIC HEMORRHAGE: Patient Presenting to the Emergency Department Setting

### OBJECTIVES

1. Demonstrate key attributes of team-based communication (Attributes of Simulation)
2. Identify obstetric hemorrhage and initiate appropriate treatment
3. Identify patient risk factors when considering treatment of obstetric hemorrhage
4. Demonstrate components of SBAR with team communication

### SIMULATION OVERVIEW

**Purpose and Assumption:** Everyone here is intelligent, well-trained, wants to be their best, and is here to improve patient care. This is not a test of individuals, it is a test of process, a tool to identify and potentially fix gaps on our unit, in our teamwork, in our communication, and the overall reliability of the care we provide. It is also an opportunity to learn and ask questions in a safe environment.

**Safety:** This simulation session is confidential and formative in nature. To allow this to be a great learning environment, we want to create a safe space. There is no shame/blame or finger pointing. We are not here to evaluate any individual performances or trick you. It's about learning, being curious, and understanding what happened in the case. The goal is to discuss what was effective or went well, what may be opportunities to do things differently and how to be more effective in practice.

**Confidentiality:** What happens in simulation, stays in simulation. This is a way to keep our environment a safe learning environment. Please feel free to bring back anything you learn to your practice, but please don't talk about anyone's performance or the case itself. This will give everyone the same opportunity as you when they participate.

**Fidelity:** We have done our best to create a realistic patient room and scenario which you might encounter in your practice. The ED patient room is equipped with noninvasive cardiopulmonary monitoring, respiratory equipment and O2 delivery.

**Expectation:** Please participate in the simulation and debriefing. Everyone has unique perspectives, insights, and ideas. The facilitator will help guide the conversation to ensure participation and that the objectives have been met.

**Videotaping/Recording:** \*Let participants know if you are/are not videotaping and, if videotaping, when it will be deleted.

**Attributes of Simulation:** Communication, Role Clarification, Situational Monitoring, Mutual Support

**SBAR:** Situation, Background, Assessment, Recommendation (either ordered or demonstrated), Closed-loop Communication

## REPORT GIVEN TO LEARNERS AT START OF SCENARIO

T.C. is a 39 y/o gravida 3, para 3 female who presents to the Emergency Department with a precipitous vaginal birth in the car approximately 10 minutes ago, newborn is vigorous and stable. Placenta is spontaneously delivered 5 minutes after the patient is in a room. Upon delivery of the placenta, the patient immediately begins having brisk vaginal bleeding.

ALLERGIES	MEDICATION(S)	PRENATAL/MED/SURG/SOCIAL HISTORY
NKDA	Synthroid, prenatal vitamin	SVD x3, currently breastfeeding Hashimoto's thyroiditis Family History HTN Right knee ACL 2008

## INITIAL PATIENT CONDITION

Fundus is boggy, heavy vaginal bleeding noted. The patient starts complaining of feeling like she is going to pass out and has nausea/vomiting. Vital signs are currently normotensive and NSR.

## CASE FLOW STATES

State/Vital Signs-Conditions	Learner(s) Outcomes or Actions Desired	Trigger to move to next state
<p><b>1. Baseline</b>            BP 120/74            HR 94, SPO2 98%            RR 16</p> <p><b>Information if/when actions warrant and/or requested by team:</b>            Fundus remains boggy            Superficial perineal laceration – not bleeding            Moderate/Heavy bleeding continues            Pelvic exam: no severe lacerations or hematomas            Placenta: Intact            Ultrasound: No retained placental fragments or free fluid in abd            Quantitative blood loss (QBL)/ Estimated blood loss (EBL) 900mL</p>	<p><b>Learner Actions:</b></p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Recognition of obstetric hemorrhage</li> <li><input type="checkbox"/> Monitor/VS - (should be asking what VS are frequently)</li> <li><input type="checkbox"/> Fundal massage</li> <li><input type="checkbox"/> Perineum exam</li> <li><input type="checkbox"/> HOB down</li> <li><input type="checkbox"/> OB consult (per protocol and access)</li> <li><input type="checkbox"/> Call for additional help               <ul style="list-style-type: none"> <li>• SBAR</li> <li>• Physician to bedside</li> </ul> </li> <li><input type="checkbox"/> 18G or larger IV (preferably x2)</li> <li><input type="checkbox"/> Administer oxytocin infusion IV, or if no IV access, IM</li> <li><input type="checkbox"/> Obtain stat labs, including blood type and crossmatch</li> <li><input type="checkbox"/> Perform a physical exam, attempting to determine Postpartum hemorrhage etiology</li> <li><input type="checkbox"/> Urinary catheter placed</li> <li><input type="checkbox"/> Pelvic exam</li> <li><input type="checkbox"/> Assess placenta as available</li> <li><input type="checkbox"/> Ultrasound exam as available</li> <li><input type="checkbox"/> Verbalize consideration of uterotonics, uterine balloon placement, or other next steps to control bleeding as resources allow</li> </ul>	<p><b>Trigger:</b></p> <ul style="list-style-type: none"> <li>• If learner fails to identify Obstetric hemorrhage (OBH) (go to State 2)</li> <li>• If learner fails to correctly identify OBH etiology (go to State 2)</li> </ul> <p><b>Education Points:</b></p> <ul style="list-style-type: none"> <li>*Lactated Ringers initially – Normal Saline with Blood Administration</li> <li>*T&amp;S/Crossmatch blood</li> <li>*Contraindications for uterotonics</li> <li>*Demonstrates how to obtain QBL in ED setting</li> <li>*Role clarification and delegation – closed loop communication</li> <li>*Family considerations/support</li> </ul>

## CASE FLOW STATES (CON'T)

State/Vital Signs-Conditions	Learner(s) Outcomes or Actions Desired	Trigger to move to next state
<p><b>2. Information if/when actions warrant:</b> Fundus remains boggy 1st degree laceration – not bleeding Moderate/Heavy bleeding continues Pelvic exam: no severe lacerations or hematomas Placenta: Intact Ultrasound: No retained placental fragments or free fluid in abd</p> <p><b>Continued vaginal bleeding with S/S Hypovolemic shock</b> BP 94/48 HR 120 SpO2 98% RR 18 Nausea/Vomiting Lab results?</p>	<p><b>Learner Actions:</b> <i>Perform any of State 1 not achieved</i></p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Uterotonics administered*</li> <li><input type="checkbox"/> Recognize S&amp;S shock</li> <li><input type="checkbox"/> Blood products ordered</li> <li><input type="checkbox"/> Prepare to activate facility Mass Transfusion Protocol</li> <li><input type="checkbox"/> Cumulative QBL (should be asking what QBL is, ongoing)</li> <li><input type="checkbox"/> Blood product administration</li> <li><input type="checkbox"/> Additional Uterotonics</li> <li><input type="checkbox"/> OR / IR Team Notification (per protocol and access)</li> <li><input type="checkbox"/> Assess need for transfer or stabilization acquired</li> <li><input type="checkbox"/> Assess perineum and apply pressure for any bleeding while awaiting more definitive treatment</li> <li><input type="checkbox"/> Begin appropriate response to uterine atony, retained placenta, laceration, hematoma</li> </ul>	<p><b>Trigger:</b></p> <ul style="list-style-type: none"> <li>• If learner fails to provide fluid resuscitation and blood product administration, patient loses consciousness (Go to State 3)</li> <li>• If learner fails to consult OB (if applicable)- patient loses consciousness (Go to State 3)</li> <li>• If learner fails to notify OR/IR (if applicable), patient loses consciousness (Go to State 3)</li> </ul> <p><b>Education Points:</b> *When to consider Massive Transfusion Protocol *SBAR</p>

## CASE FLOW STATES (CON'T)

State/Vital Signs-Conditions	Learner(s) Outcomes or Actions Desired	Trigger to move to next state
<p><b>3. Continued vaginal bleeding, Worsening hemodynamic status</b>                      BP 72/42                      HR 136                      SpO2 98%                      RR 24                      QBL/EBL additional 100mL</p>	<p><b>Learner Actions:</b>  <i>Continue with above Learner Actions</i></p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Administer additional uterotonics</li> <li><input type="checkbox"/> Continue blood product administration</li> <li><input type="checkbox"/> Cumulative QBL</li> <li><input type="checkbox"/> Assess disposition (stabilize to transfer, Operating room)</li> <li><input type="checkbox"/> Consider tools on hand (uterine balloon (Bakri), suction system (Jada), etc.</li> </ul>	<p><b>Trigger:</b></p> <ul style="list-style-type: none"> <li>• If Learner Actions not performed, provide suggestions to guide critical thinking if all learner actions completed (Go to State 4)</li> </ul> <p><b>Education Points:</b>                      *SBAR</p>
<p><b>4. Bleeding stabilized, hemodynamically improving</b>                      BP 88/52                      HR 124                      SpO2 98%                      RR 20                      QBL/EBL no additional</p>	<p><b>Learner Actions:</b>  <i>Continue with above Learner Actions</i></p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Fundus firm, midline U -1</li> <li><input type="checkbox"/> Assess perineum for any repair</li> </ul>	<p><b>Scenario complete when patient stabilized and/or interventions do not lead to identified cause - Move to Debrief</b></p>

## KEY DEBRIEFING POINTS

**1. What went well?**

**2. What were some opportunities?**

**3. Any new processes tested during this simulation?**

**4. New learnings or education gaps identified?**

**5. Any quality improvement ideas?**

## OBSTETRIC HEMORRHAGE EXAMPLE MEDICATIONS

Medication	Dose	Contraindications and Considerations
Oxytocin (Pitocin)	10u IM or IV infusion	
Methylergonovine (Methergine)	0.2 mg IM	Avoid in setting of HTN or HTN hx
Misoprostol (Cytotec)	800 mcg SL, buccal, or rectal	(for use if diagnosed with HTN and asthma)
Carboprost (Hemabate)	250 mcg IM	Avoid in setting of asthma hx
Tranexamic Acid (TXA)	1 gram IV	May repeat in 30 minutes

## CARDIAC CONDITIONS IN OBSTETRICS: Patient Presenting to the Emergency Department

### OBJECTIVES

1. Demonstrate key attributes of team-based communication (Attributes of Simulation)
2. Demonstrate components of SBAR with team communication
3. Identify pre-existing risk factors that may contribute to cardiac conditions in pregnancy
4. Identify S&S of potential cardiac conditions in pregnancy

### SIMULATION OVERVIEW

**Purpose and Assumption:** Everyone here is intelligent, well-trained, wants to be their best, and is here to improve patient care. This is not a test of individuals, it is a test of process, a tool to identify and potentially fix gaps on our unit, in our teamwork, in our communication, and the overall reliability of the care we provide. It is also an opportunity to ask questions in a safe environment.

**Safety:** This simulation session is confidential and formative in nature. To allow this to be a great learning environment, we want to create a safe space. There is no shame/blame or finger pointing. We are not here to evaluate any individual performances or trick you. It's about learning, being curious, and understanding what happened in the case. The goal is to discuss what was effective or went well, what may be opportunities to do things differently and how to be more effective in practice.

**Confidentiality:** What happens in simulation, stays in simulation. This is a way to keep our environment a safe learning environment. Please feel free to bring back anything you learn to your practice, but please don't talk about anyone's performance or the case itself. This will give everyone the same opportunity as you when they participate.

**Fidelity:** We have done our best to create a realistic patient room and scenario which you might encounter in your practice. The ED patient room is equipped with noninvasive cardiopulmonary monitoring, respiratory equipment and O2 delivery.

**Expectation:** Please participate in the simulation and debriefing. Everyone has unique perspectives, insights, and ideas. The facilitator will help guide the conversation to ensure participation and that the objectives have been met.

**Videotaping/Recording:** \*Let participants know if you are/are not videotaping and, if videotaping, when it will be deleted.

**Time Out:** Any participant may call a "time out" during a scenario, to request real time feedback and guidance while asking questions. While there is merit to allowing a scenario to run uninterrupted, if participants feel learning will be ineffective without a pause, this option is available.

**Attributes of Simulation:** Communication, Role Clarification, Situational Monitoring, Mutual Support

**SBAR:** Situation, Background, Assessment, Recommendation (either ordered or demonstrated), Closed-loop Communication

## REPORT GIVEN TO LEARNERS AT START OF SCENARIO

O.F. is a 38 y/o woman, gravida 2, para 1 at 35 weeks gestation who presents to the Emergency Dept with a dry cough and reports shortness of breath. She was diagnosed with pneumonia last week and just finished her course of antibiotics. She reports no improvement and thinks her symptoms are getting worse. The patient denies any fevers. The patient reports swelling in both her ankles.

**Alternative:** Patient may be 3 weeks postpartum, and learner must ask about recent pregnancy to determine that the patient has new onset heart failure from peripartum cardiomyopathy.

ALLERGIES	MEDICATION(S)	PRENATAL/MED/SURG/SOCIAL HISTORY
NKDA	Nifedipine, PNV	Currently breastfeeding Hashimoto's thyroiditis HTN Prior c-section

## INITIAL PATIENT CONDITION

On the physical exam, the patient is noticed to have jugular vein distention and 2+ pitting edema to the lower extremities. Lung sounds demonstrate fine crackles at the bases, with good air movement. The patient is tachypneic to 28 with mildly increased work of breathing. She answers in short sentences, but must stop to focus on breathing, in between questions. The patient's abdomen is soft and nontender, with no palpable contractions. A pelvic exam demonstrates a closed cervix with no bleeding or discharge.

## CASE FLOW STATES

State/Vital Signs-Conditions	Learner(s) Outcomes or Actions Desired	Trigger to move to next state
<p><b>1. Baseline</b>            HR 122            BP 102/54            SPO2 89% RA            RR 28            LOC AAOx4            Eyes open            Speech: short sentences,            takes breaths in between</p>	<p><b>Learner Actions:</b></p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Vital Signs/Pulse Ox               <ul style="list-style-type: none"> <li>• Lung sounds</li> <li>• Heart rhythm (murmur evaluation)</li> </ul> </li> <li><input type="checkbox"/> IV fluid assessment needs               <ul style="list-style-type: none"> <li>• 250mL fluid bolus<sup>*^</sup></li> </ul> </li> <li><input type="checkbox"/> O2 via nasal canula/mask</li> <li><input type="checkbox"/> Obtain fetal heart tones (FHT's)</li> <li><input type="checkbox"/> Avoid supine position</li> <li><input type="checkbox"/> Chest x-ray</li> <li><input type="checkbox"/> EKG</li> <li><input type="checkbox"/> BNP and other labs (CBC, CMP, ABG, urine toxicology with consent, TSH)</li> <li><input type="checkbox"/> Consider Maternal Sepsis Screening to rule out as cause of condition</li> </ul>	<p><b>Trigger:</b></p> <ul style="list-style-type: none"> <li>• If learner fails to identify oxygen administration, (go to State 2)</li> </ul> <p><b>Education Points:</b></p> <p><sup>*^</sup><b>KEY LEARNING POINT:</b> Care scenario requires judicious use of fluids with careful monitoring or intake and output. Discussion warranted.</p> <p>*Correlation with hypertension and cardiovascular risks</p> <p>*Consider discussions of standardized pregnancy risk assessment tool</p>

## SEPSIS IN OBSTETRIC CARE: Patient Presenting to the Emergency Department

### OBJECTIVES

1. Demonstrates key attributes of team-based communication (Attributes of Simulation)
2. Identify Sepsis and initiate appropriate timely treatment based on 'time zero'
3. Identify patient risk factors for infection, leading to Sepsis
4. Demonstrates components of SBAR with team communication

### SIMULATION OVERVIEW

**Purpose and Assumption:** Everyone here is intelligent, well-trained, wants to be their best, and is here to improve patient care. This is not a test of individuals, it is a test of process, a tool to identify and potentially fix gaps on our unit, in our teamwork, in our communication, and the overall reliability of the care we provide. It is also an opportunity to ask questions in a safe environment.

**Safety:** This simulation session is confidential and formative in nature. To allow this to be a great learning environment, we want to create a safe space. There is no shame/blame or finger pointing. We are not here to evaluate any individual performances or trick you. It's about learning, being curious, and understanding what happened in the case. The goal is to discuss what was effective or went well, what may be opportunities to do things differently and how to be more effective in practice.

**Confidentiality:** What happens in simulation, stays in simulation. This is a way to keep our environment a safe learning environment. Please feel free to bring back anything you learn to your practice, but please don't talk about anyone's performance or the case itself. This will give everyone the same opportunity as you when they participate.

**Fidelity:** We have done our best to create a realistic patient room and scenario which you might encounter in your practice. The ED patient room is equipped with noninvasive cardiopulmonary monitoring, respiratory equipment and O2 delivery.

**Expectation:** Please participate in the simulation and debriefing. Everyone has unique perspectives, insights, and ideas. The facilitator will help guide the conversation to ensure participation and that the objectives have been met.

**Videotaping/Recording:** \*Let participants know if you are/are not videotaping and, if videotaping, when it will be deleted.

**Time Out:** Any participant may call a "time out" during a scenario, to request real time feedback and guidance while asking questions. While there is merit to allowing a scenario to run uninterrupted, if participants feel learning will be ineffective without a pause, this option is available.

**Attributes of Simulation:** Communication, Role Clarification, Situational Monitoring, Mutual Support

**SBAR:** Situation, Background, Assessment, Recommendation (either ordered or demonstrated), Closed-loop Communication

## REPORT GIVEN TO LEARNERS AT START OF SCENARIO

S.R. 32 y/o pregnant female, gravida 3, para 2 woman at 34.2 weeks gestation who presents to the Emergency Department late in the evening, with complaints of feeling “exhausted and aching all over.” She was recently treated by her obgyn for a UTI and finished her abx as prescribed. Unsure of abx type and describes it as “a yellow pill.” Denies loss of fluid, endorses fetal movement, denies complications with her last two pregnancies, which were uncomplicated vaginal births after induction of labor at term. Patient states she has been feeling increasingly fatigued the past two days, and today she generally feels worn down and thinks she may have had fever this morning. She took two doses of Tylenol throughout the day, which helped some, but when she laid down to go to bed tonight, she began feeling much worse. Her obgyn office is 2 hours away. Denies pain other than “achiness all over.”

ALLERGIES	MEDICATION(S)	PRENATAL/MED/SURG/SOCIAL HISTORY
NKDA	PNV	Appendectomy as a child

## INITIAL PATIENT CONDITION

On the physical exam, the patient is not in any distress but appears to feel unwell and is pale. Abdomen is gravid, soft, and non-tender. Lungs CTA.

## PERINATAL MENTAL HEALTH CONDITIONS: Patient Presenting to the Emergency Department

### OBJECTIVES

1. Demonstrates key attributes of team-based communication (Attributes of Simulation)
2. Demonstrates components of SBAR with team communication
3. Identify strategies for respectful care
4. Identify the validated screening tools for perinatal mental health conditions
5. Demonstrates attributes of inclusion

### SIMULATION OVERVIEW

**Purpose and Assumption:** Everyone here is intelligent, well-trained, wants to be their best, and is here to improve patient care. This is not a test of individuals, it is a test of process, a tool to identify and potentially fix gaps on our unit, in our teamwork, in our communication, and the overall reliability of the care we provide. It is also an opportunity to ask questions in a safe environment.

**Safety:** This simulation session is confidential and formative in nature. To allow this to be a great learning environment, we want to create a safe space. There is no shame/blame or finger pointing. We are not here to evaluate any individual performances or trick you. It's about learning, being curious, and understanding what happened in the case. The goal is to discuss what was effective or went well, what may be opportunities to do things differently and how to be more effective in practice.

**Confidentiality:** What happens in simulation, stays in simulation. This is a way to keep our environment a safe learning environment. Please feel free to bring back anything you learn to your practice, but please don't talk about anyone's performance or the case itself. This will give everyone the same opportunity as you when they participate.

**Fidelity:** We have done our best to create a realistic patient room and scenario which you might encounter in your practice. The ED patient room is equipped with noninvasive cardiopulmonary monitoring, respiratory equipment and O2 delivery.

**Expectation:** Please participate in the simulation and debriefing. Everyone has unique perspectives, insights, and ideas. The facilitator will help guide the conversation to ensure participation and that the objectives have been met.

**Videotaping/Recording:** \*Let participants know if you are/are not videotaping and, if videotaping, when it will be deleted.

**Time Out:** Any participant may call a "time out" during a scenario, to request real time feedback and guidance while asking questions. While there is merit to allowing a scenario to run uninterrupted, if participants feel learning will be ineffective without a pause, this option is available.

**Attributes of Simulation:** Communication, Role Clarification, Situational Monitoring, Mutual Support

**SBAR:** Situation, Background, Assessment, Recommendation (either ordered or demonstrated), Closed-loop Communication

## REPORT GIVEN TO LEARNERS AT START OF SCENARIO

S.C. is a 19 y/o, gravida 1, para 0 at 14 weeks gestation who presents to the ED after referral from a home visiting nurse, stating she is feeling hopeless and having thoughts of killing herself and she states she has a plan. The patient has a strained relationship with her family and reports feeling “overwhelmed” and “too tired to do this anymore”, she also states “this all is just never going to get any better”. She has mentioned her feelings to her family and friends, but she is feeling unheard. She has a history of a suicide attempt, by overdose, at age 15.

ALLERGIES	MEDICATION(S)	PRENATAL/MED/SURG/SOCIAL HISTORY
PCN	PNV	History of anxiety and depression ½ pack/day smoker Drinks alcohol occasionally Occasional use of THC Lives with mother and siblings

## INITIAL PATIENT CONDITION

The patient presents to ED, tearful with noticeably poor hygiene and is very guarded with interactions. Her speech and physical exam are normal. She reports decreased sleep, appetite, and ability to focus. She reports having a “messy” home environment with a mother who has poorly controlled bipolar disorder. She feels that no one would care if she died, and she found herself in her bathroom collecting her pill bottles this morning with a plan to overdose on Tylenol PM and iron tablets. She came to the Emergency Department instead after speaking to a home visiting nurse, and “just knows I need help”.

## REPORT GIVEN TO LEARNERS AT START OF SCENARIO

**E.G. is a 37 y/o female who presents to the Emergency Department 8 days following cesarean birth of her second child with complaints of a persistent headache and flu-like symptoms that have been worsening over the past 24 hours. Denies fever, chills, SOB, or other complaints.**

ALLERGIES	MEDICATION(S)	PRENATAL/MED/SURG/SOCIAL HISTORY
PCN	PNV	Gravida 2, para 2 Cesarean delivery x's 2 History of preeclampsia in pregnancy

## INITIAL PATIENT CONDITION

On the physical exam, the patient is AAOx4. The patient describes her headache as throbbing and located in the front of her head. She denies any visual disturbances but mentions feeling unusually fatigued since delivery and reports feeling "puffy." Abd incision well approximated, without redness. Denies vaginal bleeding, discharge, or odor. Denies abd or pelvic pain "outside normal for me after delivery." Noted to have +2 edema to BLE.

## SUBSTANCE USE DISORDER IN PREGNANCY: Patient Presenting to the Emergency Department

### OBJECTIVES

1. Demonstrate key attributes of team-based communication (Attributes of Simulation)
2. Demonstrate components of SBAR with team communication
3. Identify indication for naloxone administration(s)
4. Identify S&S of opioid withdrawal

### SIMULATION OVERVIEW

**Purpose and Assumption:** Everyone here is intelligent, well-trained, wants to be their best, and is here to improve patient care. This is not a test of individuals, it is a test of process, a tool to identify and potentially fix gaps on our unit, in our teamwork, in our communication, and the overall reliability of the care we provide. It is also an opportunity to ask questions in a safe environment.

**Safety:** This simulation session is confidential and formative in nature. To allow this to be a great learning environment, we want to create a safe space. There is no shame/blame or finger pointing. We are not here to evaluate any individual performances or trick you. It's about learning, being curious, and understanding what happened in the case. The goal is to discuss what was effective or went well, what may be opportunities to do things differently and how to be more effective in practice.

**Confidentiality:** What happens in simulation, stays in simulation. This is a way to keep our environment a safe learning environment. Please feel free to bring back anything you learn to your practice, but please don't talk about anyone's performance or the case itself. This will give everyone the same opportunity as you when they participate.

**Fidelity:** We have done our best to create a realistic patient room and scenario which you might encounter in your practice. The ED patient room is equipped with noninvasive cardiopulmonary monitoring, respiratory equipment and O2 delivery.

**Expectation:** Please participate in the simulation and debriefing. Everyone has unique perspectives, insights, and ideas. The facilitator will help guide the conversation to ensure participation and that the objectives have been met.

**Videotaping/Recording:** \*Let participants know if you are/are not videotaping and, if videotaping, when it will be deleted.

**Time Out:** Any participant may call a "time out" during a scenario, to request real time feedback and guidance while asking questions. While there is merit to allowing a scenario to run uninterrupted, if participants feel learning will be ineffective without a pause, this option is available.

**Attributes of Simulation:** Communication, Role Clarification, Situational Monitoring, Mutual Support

**SBAR:** Situation, Background, Assessment, Recommendation (either ordered or demonstrated), Closed-loop Communication

## REPORT GIVEN TO LEARNERS AT START OF SCENARIO

N.J. is a 26 y/o, gravida 1 para 0 at 20 weeks' gestation who has been brought in by ambulance for altered mental status. EMS received a call from her boyfriend, who reports she was fine this morning but when he got out of the shower, he found her minimally responsive on the couch and was unable to wake her.

ALLERGIES	MEDICATION(S)	PRENATAL/MED/SURG/SOCIAL HISTORY
NKDA	Zoloft 50 mg PO qD	History of heroin use Inpatient rehab admission 6 months ago

## INITIAL PATIENT CONDITION

The patient is not answering questions but moans and withdraws to painful stimuli. Her pupils are pinpoint. Non-rebreather mask in place and her O2 sats are 92%. She has an IV in her left arm, placed in the field, by EMS.

## CASE FLOW STATES
